Revision History

Date	Description
October 2010	Initial release
January 2011	Added "Execute Program" command.
May 2011	Corrected response from Program command

IDEA Drive Communications Basics

The IDEA drive line of products are commanded through the use of an Ascii based language developed by Haydon Kerk. Each command consists of a character identifying the command, followed by between 0 and 12 parameters separated by commas, and then followed by a carriage return. One difference between this language and those used by competing products is that each motion command encapsulates all parameters needed by the move; there are no parameters to set before a move command is issued. While this makes manual entry of commands into a terminal cumbersome, this is not the intended use of the language. Creation of these commands can be done simply in the software of the controller used to command the drives.

The IDEA drive adheres to a master/slave communications model. The master controller initiates all communications. If information is required from the drive, as in the case of requesting the drive's current position, the controller first sends the command requesting the drive's position, then the drive responds with the requested information, enclosed by several characters to identify the response. The extra characters can then be parsed, and the response read.

For the RS-485 communication option, several drives can be daisy chained together on a single bus. This allows a single controller to send commands to all the drives at once. In this configuration, for each drive to be controlled separately, they must each be given a unique identifier, a number between 0 and 255. This must be done with only one drive attached. The user interface has a function built in to make this process simple. Once each drive on the bus has its own identifier, any command that is sent starting with the '#" character followed by an identifier, followed by the normal command, will be ignored by any drive whose identifier does not match the provided identifier. For example, to send an abort command to the drive whose identifier is 123, the controller would send "#123A" followed by a carriage return. If a command should be executed by all drives at once, the controller would omit the pound and identifier. It is important that the controller never request a response from all the drives at once, as this will cause a data collision when all the drives attempt to respond at once.

One major difference between using this command set to control the drive, and using the IDEA drive user interface is, there are no protections when using the

command language. The user interface ensures that based upon the part number entered, no improper values are sent to the drive; with this command set, it is the responsibility of the user to ensure that no damage is done to the drive, motor, or other equipment through the incorrect use of commands.

The parameters for serial communication are as follows:

Bits per Second: 57600

Data bits: 8

Parity: none

Stop Bits: 1

Flow Control: None

6

Commands

The following describes the commands that make up the IDEA drive communications language, as well as the format for any response required from the drive. When quotation marks are present, the text in between the quotation marks is the important string, and the quotation marks themselves should not be included. When [cr] is shown, it is referring to the Ascii carriage return character, not to be confused with a line feed character. When [parameter] is shown, where parameter is the name of a parameter, it is representing some variable with that name, and the brackets will not be part of the string.

The contexts listed below indicate when each command can be used. Realtime commands can only be executed by direct command to the drive, such as requesting the current position. Program commands can only be a part of a program, and are generally branching or similar commands, such as Goto. Realtime/Program commands can be used anytime, and are generally motion related commands, such as Index. For further explanation of the commands, refer to the IDEA drive users' manual.

New Position		ion, as 1/64th steps, o become.	-18446744073709551616 to 18446744073709551615		
Example	After homing, you want to set the current location to 0.				
Command	"Z0" follo	wed by a carriage ret	turn.		

Command	Symbol	Context	<u>Arguments</u>	Response	
Wait For Move	F	Program	none	None	
MOVE	Г	Flogram	Tione	INOTIE	
Description	This command causes the program to delay execution of the next command until the motor has stopped moving.				
Arguments		Argum	ent Description	Valid Values or Range	
none					
	You have started a move command and do not want the next command to execute until				
Example	the move has finished.				
Command	"F" followed by a carriage return.				

Command	Symbol	Context	<u>Arguments</u>	Response			
Wait Time	W	Program	Time	None			
Description	This command causes the program to delay execution of the next command for a specified time.						
				Valid Values			
<u>Arguments</u>	Argument Description or Range						
	The amount of time, in milliseconds, that the command should be						
Time	delayed. 0 to 65535						
	You have started a move command and do not want the next command to execute for 1						
Example	second.						
Command	"W1000"	followed by a carria	age return.				

Command	Symbol	Context	<u>Arguments</u>	Response	
E-Stop	E	RealTime/Program	Decel Current, Hold Current, Delay Time	None	
<u>Description</u>	This comma	nd stops the motor wi	thout decelerating.		
Arguments		Argument D	<u>escription</u>	Valid Values or Range	
Decel Current	The rms current, in milliamps, used to stop the motor. 0 to 5005, do no Drive				
Hold Current	The rms current, in milliamps, for after the motor has stopped. 0 to 3850, dependant on Drive				
Delay	The time, in milliamps, between the last step of a move and when the current is set to the hold current. 50 to 300				
<u>Example</u>	You wish to immediately stop the motor with a decel current of 2.0 Arms, and waiting .05 seconds between the last step and changing to a hold current of 0.5 Arms.				
Command	"E2000,500,50" followed by a carriage return				

Command	Symbol	Context	Arguments	Response					
			End Speed, Decel rate, run current, decel current, hold current, delay time, step						
Stop	Н	RealTime/Program	mode	None					
<u>Description</u>	This command stops the motor using an optional deceleration ramp.								
<u>Arguments</u>			<u>Description</u>	Valid Values or Range					
End Speed		The number of steps per second the motor should move 0 or 50 to when ending the move, in the given step mode. less than							
Decel Rate	Rate at which the speed should fall from the current speed to the end speed. 0, or 500 to 1677721								
Run Current	The rms current, in milliamps for the deceleration, if too long to use boosted decel current for the entire ramp. 0 to 3850, dependant Drive								
Hold Current	The rms of complete	• •	for after the move has	0 to 3850, dependant on Drive					
Decel Current	The rms of the move		for the deceleration portion of	0 to 5005, dependant on Drive					
Delay		in milliamps, between current is set to the h	n the last step of a move and old current.	50 to 300					
Step Mode	Defines the and so or	•	is a full step, 2 is a half step,	1,2,4,8,16,32,64.					
<u>Example</u>	You wish to stop the motor, in 1/8th step mode, decelerating at a rate of 100000 1/8th steps per second per second to a end speed of 2000 1/8th steps per second, with a run current of 1.6 Arms, decel current of 2.0 Arms, and waiting .05 seconds between the last step and changing to a hold current of 0.5 Arms.								
Command	"H2000,1	"H2000,100000,1600,2000,500,50,8" followed by a carriage return							

Command	Symbol	Context	<u>Arguments</u>	Response					
Jump N									
Times	J	Program	Destination, Jumps	None					
	This command causes the program to continue execution at the specified address a								
<u>Description</u>	specified	specified number of times.							
<u>Arguments</u>		Argument Des	cription	Valid Values or Range					
				0 to 86012, multiples of four only.					
				Must be the address of a valid					
Destination	The addre	ess of the comman	d that should be run.	command.					
	The number	ber of times executi	ion should branch to						
Jumps	the destir	nation address.		0 to 65535					
<u>Example</u>	You want to continue execution at address 1024, and do so 3 times.								
Command	"J1024, 3" followed by a carriage return.								

Com	<u>mand</u>	S	<u>/mbol</u>	Con	text		Argu	<u>Arguments</u>					Re	spon	<u>se</u>	
Goto	lf	L		Prog	ram		Dest	inatior	n, Con	dition				No	ne	
Desc	ription	This command causes the program to continue execution at the specified address if the condition is met.														
Argu	ıments		Argument Description										<u>Valid Values</u> or Range			
												mı fou be		of . Must ddress		
Desti	ination	Th	ne addr	ess of	the co	mmar	nd that	should	d be ru	ın.				_	mman	
Conc	dition	2 bytes indicating which I/O are tested, and the test values for each. The least significant byte corresponds to the inputs, and the most significant byte corresponds to the outputs. For each byte, the least significant nibble represents the condition being tested, a 1 meaning a high input or output, and a 0 representing a low input or output. The more significant nibble decides which of those conditions are to be tested, with a 1 representing an input or output should be tested. The least significant

Com	<u>mand</u>	"L	1024, 3	34" foll	owed I	by a ca	arriage	returr	١.							

Command	Symbol	Context	<u>A</u>	guments				Respoi	<u>ıse</u>	
Set Outputs	0	Realtime/Pr	ogram O	utput Value		None				
Description	This comr	This command sets the state of the outputs.								
Arguments		Argument Description Valid Values or Range								
Output Value	to. The mo	1 byte indicating which outputs should be set and what they should be set to. The most significant nibble indicates which outputs are being set, and the least significant nibble controls what they are being set to.								
Example	You want to set output 3 high, output 2 low, and want to leave outputs 1 and 4 unchanged.									
Bit 8 = 128	Bit 7 = 64							Total		
0	1	1	0	0 1 0 0 100						
Command	"O100" fol	llowed by a c	arriage ret	ırn.					•	

Command	Symbol	Context	<u>Arguments</u>	Respor	<u>ıse</u>			
Label	В	Program	Label name	None				
Description	This com	This command creates a label in the program.						
<u>Arguments</u>	Argument Description Valid Va							
Label Name	A string, i	must be exactly 10	characters long.					
Example	You want to add a label called "Start".							
Command	"BStart	"BStart" followed by a carriage return.						

Command	Symbol	Context	<u>Arguments</u>	<u>Response</u>				
Comment	С	Program	Comment	None				
Description	This command creates a comment in the program.							
		<u>Valid Values</u>						
<u>Arguments</u>			<u>or Range</u>					
Comment	A string, r	must be exactly	10 characters long.					
<u>Example</u>	You want to add a comment that says "Extend 1in".							
Command	"CExtend 1in" followed by a carriage return.							

Command	Symbol	Context	<u>Arguments</u>	<u>Response</u>						
Interrupt on Position	Т	Program	Position, Destination, Priority	None						
Description	This command sets an interrupt to occur at a given position.									
<u>Arguments</u>		<u>Argu</u>	ment Description	Valid Values or Range						
Position	The posit	ion where the	-18446744073709551616 to 18446744073709551615							
Destination	The address triggere	ess of the subred.	0 to 86012, multiples of four only. Must be the address of a valid command.							
Priority	The priori priority.	ity of the interr	0 to 4, 10 to disable							
<u>Example</u>	You want to set a trip point at position 0, that runs a subroutine at address 1024, and has the highest priority.									
Command	"T0,1024	"T0,1024,0" followed by a carriage return								

<u>Command</u>	Symbol	Context	<u>Arguments</u>	Response					
Configure			DeadBand, StallHunts,						
Encoder	Z	Realtime/Program	Destination, Priority	None					
Description	This com	mand configures the	encoder.						
<u>Arguments</u>		<u>Argument</u>	<u>Description</u>	Valid Values or Range					
	The numb	ber of steps away fro	1 to 65535, or 0 to						
DeadBand	the drive	will begin to correct.		disable					
Stall Hunts	The number	ber of attempts at a g	given move the drive will make.	0 to 255					
				0 to 86012, multiples of					
				four only. Must be the					
			that should be run after all stall	address of a valid					
Destination		exhausted, if desire		command.					
	The priori	ity of the interrupt for	when the stall hunts are						
Priority	exhauste	d.		0 to 4, 10 to disable					
	You want	the drive to correct f	or position errors greater than 3 s	steps, retry moves twice,					
Example	and do no	ot want to trigger an i	nterrupt after the second failure.						
Command	"z3,2,0,10	O" followed by a carri	age return.						

Command	Symbol	Context	Arguments	Response						
Abort	Α	Realtime/Program	none	None						
Description		This command causes the drive to immediately stop, and ends the execution and of any programs.								
<u>Arguments</u>	Argument Description Valid Values or Range									
none										
Example	You want to stop all drive activity.									
Command	"A" followed by a carriage return.									

Command	Symbol	Context	Context Arguments							
Software										
Reset	R	Realtime/Program	none	None						
Description	This command causes the drive to restart, acts the same as cycling power.									
Arguments		<u>Argumen</u>	t Description	Valid Values or Range						
none										
Example	You want to restart the drive.									
Command	"R" followed by a carriage return.									

Command		Symbol	Context	Argumen	ıts	Respo	nse			
Read IO		:	Realtime	none		"`:[value][CR]`:#[CR]", Where [value] is a number between 0 and 255, formed from 1 byte, with ones being highs, zeros being lows, the most significant be corresponding to output4, and the least significant bit corresponding to input1.				
Descriptio	This command requests the status of the inputs and outputs.									
Arguments	3	Ar	gument Des	scription		Valid Values or Range				
none										
<u>Example</u>		Want to know the status of the input and outputs. For this example, outputs 1 and 2 will be high, and inputs 2, 3, and 4 will be high, all others will be low.								
Command	Command ":" followed by a carriage return.									
Output4	0	utput 3	Output 2	Output 1	Inp	out 4	Input 3	Input 2	Input 1	Value
0	0		1	1	1		1	1	0	62

Command	Symbol	Context	Arguments	Response			
			Password,	The commands that make up the program,			
Recall			Program	unless the password was incorrect, in			
Program	@	Realtime	Name	which case there is no response.			
Description	This command requests the program be read back.						
<u>Arguments</u>		Argument Desc	<u>ription</u>	Valid Values or Range			
Password	The pass	word for the drive		A string; must be exactly 10 characters.			
Program							
Name	The name	e of the program to	be read back.	A string; must be exactly 10 characters.			
Example	Want to read back a program named "program 1" from the drive, with no password.						
Command	"@ ,program 1 " followed by a carriage return.						

Command	Symbol	Context	<u>Arguments</u>	Response		
Program	Р	Realtime	(Program Name, Start Location, Length) or none	None or "`P[Program size][CR]`P#[CR]"		
<u>Description</u>	This com	mand starts and e	nds the process of writing a program.			
Arguments		Argument Description Valid Values or Range				
Program Name		e for the program, ive, the old progra	A string; must be exactly 10 characters.			
Start Location	The memory address where the program should begin. If the program overlaps with any other program, the old program will be deleted. 0 to 86016, multiples of 1024 only.					
Length	The number of pages the program will take up.			1 to 85		
Example	You want to write a program name program 1, on the first page of memory.					
Command		"Pprogram 1 , 0,1" followed by the commands that make up the program, each separated by a carriage return, followed by "P" followed by a carriage return.				

Command	Symbol	Context	<u>Arguments</u>	<u>Response</u>	
Return	Χ	Program	none	None	
Description	This com	This command returns from a subroutine.			
	Valid Values				
<u>Arguments</u>		<u>Argument Description</u> <u>or Range</u>			
none					
Example	You want to return from a subroutine to where the subroutine was called from.				
Command	"X" followed by a carriage return.				

Command	Symbol	Context	<u>Arguments</u>	Response			
Return To	V	Program	Destination	None			
Description		This command exits a subroutine, branches to a location, and clears all pending interrupts, the return stack and the loop counters.					
<u>Arguments</u>	Argument Description			Valid Values or Range			
Destination	The address to which the program should branch.			0 to 87036, multiples of four only.			
Example	You want to exit a subroutine and continue execution somewhere other than where the subroutine was called from, in this case, address 32.						
Command	"V32" follo	owed by a carriage	return.	_			

Command	Symbol	Context	Arguments	Response
Read Program Names Description	N This comp	Realtime	none	"`N[program1 name],[start page],[end page][CR]`N[program2 name],[start page],[end page][CR]`N#[CR]" More programs would have more entries. m names and addresses be sent.
Description				
<u>Arguments</u>	Arg	gument Des	<u>cription</u>	Valid Values or Range
none				
Example	You want to know what programs are residing on the drive.			
Command	"N" followed by a carriage return.			

Command	Symbol	Context	Arguments	Response			
Read				"`K[program name][CR]`K#[CR]" If there is no			
Startup				startup program, [program name] will be an empty			
Program	K	Realtime	none	string.			
Description	This command requests the name of the startup program.						
Arguments	Ar	gument Des	<u>cription</u>	Valid Values or Range			
none							
Example	Want to know what program is set to run on power up.						
Command	"K" follow	"K" followed by a carriage return.					

Command	Symbol	Context	<u>Arguments</u>	<u>Response</u>		
Remove Program	D	Realtime	Program name	None		
<u>Description</u>	This comm	This command removes a program.				
<u>Arguments</u>		Argument Description Valid Values or Rar				
				A string, exactly 10		
Program Name	The name of the program to be deleted. characters long					
<u>Example</u>	You want to remove a program named "program 1 " from the drive.					
Command	"Dprogram 1 " followed by a carriage return.					

Command	Symbol	Context	<u>Arguments</u>	Response		
Set Startup Program	U	Realtime	Program name	None		
Description	This com	This command sets a program as the startup program.				
Arguments		<u>Argum</u>	ent Description	Valid Values or Range		
Program Name	The name of the program to start on power up or reset. A string, exactly 10 characters long					
<u>Example</u>	You want to set a program named "program 1 " as the startup program.					
Command	"Uprograi	"Uprogram 1 " followed by a carriage return.				

Command	Symbol	Context	<u>Arguments</u>	Response	
Run Program	Υ	Realtime	Program name	None	
		•	ion of a program, first retur	ning to step 0 and setting	
<u>Description</u>	all outputs	low.			
<u>Arguments</u>	<u>Argument Description</u> <u>Valid Values or Range</u>				
	A string, exactly 10				
Program Name	The name of the program to run. characters long				
Example	You want to run a program named "program 1 ", starting from the default state.				
Command	"Yprogram 1 " followed by a carriage return.				

Command	Symbol	Context	<u>Arguments</u>	Response			
Execute							
Program	m	Realtime	Program name	None			
	This comn	This command begins the execution of a program without changing the state of the					
<u>Description</u>	outputs or	outputs or motor.					
<u>Arguments</u>		Argument Description Valid Values o					
Program Name	A string, exactly 10 The name of the program to run. A string, exactly 10 characters long						
Example	You want to run a program named "program 1 ", without returning to the default state.						
Command	"mprogran	"mprogram 1 " followed by a carriage return.					

Command	Symbol	Context	Arguments .	Response		
Configure Input Interrupts	i	Program	Input1 config, input2 config, input3 config, input4 config, intput1 destination, input2 destination, input3 destination, input4 destination, input1 priority, input2 priority, input3 priority, input4 priority	None		
<u>Description</u>	This command is used to configure the interrupt settings for in inputs.					
<u>Arguments</u>	Argument Description Valid Values or Range					
Config	What kind of interrupt the input should be. 1 for Falling edge, 2 for rising edge, 3 for both edges, 0 for disabled. 0,1,2,3					
Destination	The address of the subroutine that should handle the interrupt. O to 87036, multiples of four only.					
Priority	The priority of the interrupt; lower numbered priorities are handled first. 0 to 4					
<u>Example</u>	You want to set a rising edge interrupt on input 2, whose destination is address 512 and priority is 1, and all other input interrupts disabled.					
Command	"i0,2,0,0,0	0,512,0,0,4,	1,4,4" followed by a carriage return.	_		

Command	Symbol	Context	Arguments	Response	
Set Password	р	Realtime	Password	None	
<u>Description</u>	This command so	This command sets a password, if none exists.			
<u>Arguments</u>	Argu	ment Descrip	tion_	Valid Values or Range	
Password	The desired pass	sword.		A string, exactly 10 characters long	
Example	You want to set the password as "password ".				
Command	"ppassword " followed by a carriage return.				

Command	Symbol	Context	<u>Arguments</u>	Response		
Check Password	С	Realtime	Password	"`cYES[cr]`c#[cr]" or "`cNO[cr]`c#[cr]"		
<u>Description</u>	This commar	This command checks to see if a password is the correct password.				
<u>Arguments</u>	Ar	gument Descrip	otion_	Valid Values or Range		
Password	The passwor	d in question.		A string, exactly 10 characters long		
Example	You want to check if the password is "password ".					
Command	"cpassword	"cpassword " followed by a carriage return.				

Command	Symbol	Context	<u>Arguments</u>	Response	
Remove					
Password	q	Realtime	Password	None	
Description	This com	mand removes a p	assword.		
Arguments		Argument Description Valid Values or Range			
Password	The curre	ent password		A string, exactly 10 characters long	
Example	You want to remove the password "password ".				
Command	"qpasswo	ord " followed by a	carriage return.		

Command	Symbol	Context	<u>Arguments</u>	<u>Response</u>	
				"`f[value][cr]`f#[cr]" where value	
Read Faults	f	Realtime	None	represents the errors present.	
Description	This com	mand requests th	ne error status of the drive.		
<u>Arguments</u>		Argument Description Valid Values or Range			
None					
Example	You want to check the error status of the drive.				
Command	"f" followe	ed by a carriage r	eturn.		

Command	Symbol	Context	<u>Arguments</u>	Response		
Restore						
Factory Defaults	а	Realtime	None	None		
Description	This com	This command removes the drive password and deletes all the programs on the drive.				
<u>Arguments</u>		<u>Argumer</u>	nt Description	Valid Values or Range		
None						
Example	You want to remove the password on a drive, but forgot that password.					
Command	"a" followed by a carriage return.					

Command	Symbol	Context	<u>Arguments</u>	Response	
Read				"`l[value][cr]`l#[cr]" where	
Current				value represents the motor	
Position	1	Realtime	None	position.	
	This com	mand requests th	e position of the motor either the	oretical, or actual if an encoder	
Description	is enable	•	- p		
<u>Arguments</u>		Argument Description Valid Values or Range			
None					
<u>Example</u>	You want to check the position of the drive.				
Command	"I" followe	ed by a carriage re	eturn.		

Command	Symbol	Context	<u>Arguments</u>	Response	
Read				"`rYES[cr]`I#[cr]" or	
Executing	r	Realtime	None	"`rNO[cr]`l#[cr]"	
Description	This com	This command requests whether the drive is actively running a program.			
<u>Arguments</u>	Argument Description Valid Values or Range			Valid Values or Range	
None					
Example	You want to check if the drive is executing a program.				
Command	"r" followe	ed by a carriage re	turn.		

Command	Symbol	Context	<u>Arguments</u>	Response	
Read Firmware Version	v	Realtime	None	"`v[value][cr]`v#[cr]" where [value] is a number.	
Description	This com	mand requests	the firmware version of the	e drive.	
<u>Arguments</u>		Argument Description Valid Values or Range			
None					
Example	You want to check the firmware version on the drive.				
Command	"v" followed by a carriage return.				

Command	Symbol	Context	Arguments	Response		
Read Encoder Settings	Ь	Realtime	None	"`b[deadband],[stallhunts][cr]`b#[cr]"		
3						
Description	This com	mand request	s the encoder configu	uration of the drive.		
Arguments		Argumen	t Description	Valid Values or Range		
None						
Example	You want to check the encoder settings on the drive.					
Command	"b" follow	"b" followed by a carriage return.				

Command	Symbol	Context	<u>Arguments</u>	Response		
No-op	W	Program	none	None		
Description	This com	This command is used to insert an extra line in a program.				
Arguments	Argument Description Valid Values or Range			Valid Values or Range		
none						
Example	This command would be used in a custom user interface.					
Command	"w" followed by a carriage return.					

Command	Symbol	Context	<u>Arguments</u>	Response	
Read Max				"`j[value][cr]`j#[cr]" where	
Current	j	Realtime	None	[value] is a number.	
<u>Description</u>	This com	This command requests the maximum current setting of the drive.			
<u>Arguments</u>		<u>Argument</u>	t Description	Valid Values or Range	
None					
<u>Example</u>	You want to check the maximum current of the drive.				
Command	"j" followe	ed by a carriage re	turn.		

Command	Symbol	Context	<u>Arguments</u>	Response		
Read Drive Number	k	Realtime	None	"`k[value][cr]`k#[cr]" where [value] is a number.		
Description	This com	This command requests drive identifier.				
<u>Arguments</u>	Argument Description			Valid Values or Range		
None						
<u>Example</u>	You want to read the drive's identifier.					
Command	"k" follow	"k" followed by a carriage return.				

Command	Symbol	Context	<u>Arguments</u>	Response		
Assign						
Drive						
Number	у	Realtime	Identifier	None		
Description	This com	mand assigns th	ne drive an identifier.			
<u>Arguments</u>		Argument Description Valid Values or Range				
Identifier	The number that should be associated with the drive. 0 to 255					
Example	You want to set the drive's identifier to 136.					
Command	"y136" fo	"y136" followed by a carriage return.
